

Read the text about Rainforests carefully. Then, on your paper, draw a mind map showing the main topic and the subtopics with their important details.

Rainforests

Rainforests are large, warm, and wet forests found near the equator. They are home to many kinds of plants and animals and play a big role in cleaning the air and giving us oxygen.

The canopy is the top part of the rainforest. It gets the most sunlight. Birds, monkeys, and insects live there. The leaves are thick and help stop heavy rain from reaching the ground.

The forest floor is dark and wet. Big animals like jaguars and tapirs walk there. The ground is covered with leaves that turn into rich soil and help new plants grow.
